

Frequently Asked Questions

Fraida Fund

Will we have live meetings? Is this course synchronous or asynchronous?

This course is asynchronous, which means that we do not have scheduled course meetings **except for the midterm and final exams**.

The course is organized into modules. At the beginning of each week, materials for the week's module (including video lessons, slides/notes, and Python notebooks) will be posted on NYU Brightspace. You will work through this material during the week, at whatever time is convenient for you. At the end of the week, you'll be assigned some homework related to that week's module, which you'll submit online.

The midterm and final exams will be synchronous, and will be held during the week indicated in the course syllabus. Several time slots will be offered during this week, so that you can select the one that does not conflict with your work or course schedule. The exams will be held in person for most students, subject to the following:

- A student who is enrolled in any in-person class in NYC during this semester will take midterm and final exams in person.
- A student who is not enrolled in any in-person class in NYC this semester may take the midterm and final exams online. (These students will also take the exam in one of the offered time slots, and will be proctored online.)
- If you require online exams for another valid reason, you must contact the instructor for permission in advance.

How can I get help or ask questions about the course material?

This is a challenging, fast-paced course, and includes quite a bit of material you will need to work through each week. But, you're not alone - I am always happy to answer questions, clarify any points of uncertainty, or explain anything that needs extra explanation.

There are two main ways to get help:

- Post a question on the Q&A forum for this course.
- Attend a Zoom office hours session with the instructor. (Zoom office hours are scheduled once per week.)
- Attend a Zoom office hours session with a course assistant.

(Note that you can ask questions **anonymously** on the Q&A forum, if you feel more comfortable that way.)

How will my work in this course be evaluated?

Your mastery of the course material will be evaluated by your performance on:

- **Homework problem sets:** These are computer-graded, and you'll have instant feedback as you work, so you'll know whether your answers are correct or not. If you manage your time well, you'll be able to get help or ask clarifying questions so that you can improve your understanding on questions you did not answer correctly, and re-submit a corrected answer for credit.

- **“Lab” assignments:** Some modules include a “lab” assignment that expands on the technique you learned that week. You’ll be given a Python notebook with some cells missing; you’ll have to fill in code or answer questions in the missing cells.
- **Exams:** The course will include a midterm exam and a final exam. You’ll have a few choices of dates/times for each exam, so you can select one that does not conflict with your course schedule or other responsibilities.

The relative weight of each of these components will be shared via the course syllabus in the first week of the semester.

How much time should I expect to spend on this course?

This is a 3-credit course. During a fall or spring semester, the average student should spend at least 3 hours/week/credit → 9 hours/week for a 3 credit course.

A typical week will include the following:

- pre-lecture reading (some weeks) or study time (30-60 minutes)
- a “chalkboard lecture” about 120 minutes long
- a “Python notebook” video about 90-120 minutes long
- a homework problem set (estimated time: 1-2 hours)
- a lab assignment (estimated time: 2-3 hours)

A student who is not very comfortable with the prerequisites may have to spend more time than the estimated 9 hours/week in order to do well.

What are the prerequisites for this course?

This course is mathematically oriented, and undergraduate-level knowledge of probability and linear algebra is required.

If you want to brush up, you can review:

- [Review of Probability Theory](http://cs229.stanford.edu/section/cs229-prob.pdf) (<http://cs229.stanford.edu/section/cs229-prob.pdf>)
- In [Boyd and Vandenberghe “Introduction to Applied Linear Algebra”](http://vmls-book.stanford.edu/vmls.pdf) (<http://vmls-book.stanford.edu/vmls.pdf>):
 - Section I, Chapter 1 (Vectors): vectors, vector addition, scalar-vector multiplication, inner product (dot product), complexity of vector computations
 - Section I, Chapter 3 (Norm and distance): Norm of a vector, euclidean distance, complexity
 - Section II, Chapter 5 (Matrices): matrix notation, zero and identity matrices, sparse matrices, matrix transposition, matrix addition, scalar-matrix multiplication, matrix norm, matrix-vector multiplication, complexity
 - Section II, Chapter 8 (Linear equations): systems of linear equations
 - Section II, Chapter 10 (Matrix multiplication): matrix-matrix multiplication
 - Section II, Chapter 11 (Matrix inverses): Inverse, solving a system of linear equations
 - Also a quick optimization review: Appendix C (Derivatives and optimization)
 - And a brief introduction to algorithm complexity: Appendix B (Complexity)

There will be a significant programming component to this course, and class and homework exercises will be in Python. You do not need to know Python a priori, but you should know programming concepts and have experience programming in some programming language, and you should be comfortable picking up Python basics independently. We will review some important Python basics in the first week of the course.

Do I need previous experience with machine learning for this course?

This is an introductory graduate level course and no prior machine learning knowledge will be assumed. If you already have significant ML experience, there is no need to take this class.

Do I need a computer with a GPU? Will I have to install some software on my computer?

In this course, we will use the Google Colab environment for practical programming demos and exercises. Colab is a free browser-based environment for Python programming. You don't need to install anything to use Colab - you'll just need a browser.

Do I need a textbook for this course?

You won't need to buy a textbook - all of the materials you'll need will be posted on the course site.

What topics will be included?

Here is a rough outline of the course content (subject to change):

1. Intro to ML, Python + numpy, exploratory data analysis
2. Linear regression
3. Gradient descent, bias-variance tradeoff
4. Model selection and regularization
5. Logistic regression for classification
6. K nearest neighbor
7. Decision trees, ensembles
8. Support vector machines, kernel trick
9. Neural networks
10. Deep learning, convolutional networks, transfer learning
11. Deploying machine learning systems
12. Unsupervised learning

Other important policies

Inclusion

The NYU Tandon School values an inclusive and equitable environment for all our students. I hope to foster a sense of community in this class and consider it a place where individuals of all backgrounds, beliefs, ethnicities, national origins, gender identities, sexual orientations, religious and political affiliations, and abilities will be treated with respect. It is my intent that all students' learning needs be addressed both in and out of class, and that the diversity that students bring to this class be viewed as a resource, strength and benefit. If this standard is not being upheld, please feel free to speak with me.

Disability

If you are student with a disability who is requesting accommodations, please contact New York University's Moses Center for Students with Disabilities (CSD) at 212-998-4980 or mosescsd@nyu.edu. You must be registered with CSD to receive accommodations. Information about the Moses Center can be found at www.nyu.edu/csd. The Moses Center is located at 726 Broadway on the 3rd floor.

Note for those who require accommodations for timed assessments: the final exam will be a timed exam.

Illness or other exceptional situation

If you are experiencing an illness or any other situation that might affect your academic performance in a class, please contact the student advocate: eng.studentadvocate@nyu.edu. The student advocate can reach out to your instructors to make arrangements on your behalf, when warranted.
